

1. Write a C++/Java program that performs the **basic I/O** using the concepts of class and objects. [No static initialization will be allowed. Any input must be through the constructor functions and the output through the member functions.]
2. Write a C++/Java program that uses **reference variables as arguments** to swap the values of a pair of integers using the concepts of class and objects. [No static initialization will be allowed. Any input must be through the constructor functions and the output through the member functions.]
3. Write a C++/Java program that performs **basic arithmetic operations** using the concepts of class and objects. [No static initialization will be allowed. Any input must be through the constructor functions and the output through the member functions.]
4. Write a C++/Java program that handles the **students' records** using the concepts of class and objects. [No static initialization will be allowed. Any input must be through the constructor functions and the output through the member functions.]
5. Write a C++/Java program that calculates the **GPA for students** using the concepts of class and objects. [No static initialization will be allowed. Any input must be through the constructor functions and the output through the member functions.]
6. Write a C++/Java program that calculates the **CGPA for students** using the concepts of class and objects. [No static initialization will be allowed. Any input must be through the constructor functions and the output through the member functions.]
7. Write a C++/Java program that checks whether a given integer **prime or not** using the concepts of class and objects. [No static initialization will be allowed. Any input must be through the constructor functions and the output through the member functions.]
8. Write a C++/Java program that finds the **factorial of a given number** using the concepts of class and objects. [No static initialization will be allowed. Any input must be through the constructor functions and the output through the member functions.]
9. Write a C++/Java program that calculates the **summation of any given series** of numbers using the concepts of class and objects. [No static initialization will be allowed. Any input must be through the constructor functions and the output through the member functions.]
10. Write a C++/Java program that uses **static data members** using the concepts of class and objects. [No static initialization will be allowed. Any input must be through the constructor functions and the output through the member functions.]
11. Write a C++/Java program that uses **static member functions** using the concepts of class and objects. [No static initialization will be allowed. Any input must be through the constructor functions and the output through the member functions.]
12. Write a C++/Java program that implements the concept of constructor overloading.
13. Write a C++/Java program that implements the concept of copy constructor.
14. Write a C++/Java program that implements the concept run-time function overloading.
15. Write a C++/Java program that implements the concept of constructor with default arguments.
16. Write a C++/Java program that implements the concept of destructor.
